Large Financial Service Provider Moves to Modern Scalable Storages with No Migration Cost

Challenges

When running out of storage space, a major Asian financial service provider started to look for a new cost-efficient and scalable solution to support the exponential data growth in long term.

However, the organisation faced the dilemma to either go through the costly and time-consuming data migration to a new storage, or to constantly deal with different interfaces of the existing and new storages.

Solution

EasiShare is a flexible and a secure platform with multiple connectors that acted as a middleware between the organisation's existing systems and a newly implemented modern storage technology. With EasiShare, the organisation was able to avoid the painful data migration process and to unify different storage interfaces.

EasiShare serves as a single and easy-to-use platform for IT administrators to track all file activities. As for the end-users, EasiShare has become an indispensable tool for secure file sharing and for automatic data backup on their personal devices.

Results

- Financial Service Provider was able to adopt new cost-effective and scalable storage technologies without the costly migration
- Users do not have to go to different applications to access their files as they have a unified interface
- Improved employee productivity by 40% by reducing the time spent on navigating multiple systems in day-to-day operations
- Reduced time on provisioning access and tracking user activities in multiple systems
- EasiShare has no dependency on single storage and doesn't have lock-ins

“ Save cost on migration and the changing of new storages ”
